

APEX MOTORS

ASSIGNMENT 2 ? ADVANCED CSS: FLEXBOX & GRID

Web Design Submission Report

Group: SE-2507

Team: Arsen, Kuttibay, Farabi, Muhammad

Objective

Demonstrate advanced CSS layout through a responsive dealership site with the supplied local Apex Motors logo, Flexbox navigation and cards, explicit Grid areas, and a nine-image gallery.

Repository and live site

vertex-blip.github.io/Car-dealership-website/

Scope and team

ASSIGNMENT 2 ONLY

This report covers only Assignment 2: Advanced CSS: Flexbox & Grid. Assignment 1 sections are intentionally excluded. Apex Motors is the team project for Group SE-2507.

Members and roles

- ? Arsen ? Finance Consultant
- ? Kuttibay ? Marketing Specialist
- ? Farabi ? Owner
- ? Muhammad ? Client Care

Final objective

Create a polished connected dealership interface that demonstrates modern CSS layout without Bootstrap, Tailwind, external UI libraries, or copied templates.

Task 1 - Flexbox navigation

SUPPLIED LOCAL LOGO AND ALIGNMENT

All nine HTML pages share a .nav-wrap Flexbox header. The supplied Apex Motors artwork is stored locally at images/apex-motors-logo.png and displayed as the accessible logo link at the left of the navigation.

Implementation

? `display:flex; align-items:center; justify-content:space-between` keeps logo and links aligned.

? The supplied PNG uses scoped width, fixed height, object-fit, object-position, hover opacity, and mobile sizing rules.

? Navigation wraps and stacks at responsive breakpoints.

Evidence

All nine pages contain `src="images/apex-motors-logo.png"` and `alt="Apex Motors home"`.

Task 2 - Flexbox cards

EQUAL-HEIGHT CONTENT ROWS

The `.cards` row uses Flexbox with `align-items:stretch`. Each `.card` uses `flex:1` and a column direction so images, content, and buttons align consistently.

Implementation

- ? Home and services use equal-width card rows with gaps, images, titles, descriptions, and buttons.
- ? `card-body` uses `flex-direction:column` and `margin-top:auto` for button alignment.
- ? Hover states lift cards subtly and mobile CSS changes rows to one column.

Task 3 - Grid page layout

HEADER, SIDEBAR, MAIN, AND FOOTER AREAS

Inventory and services demonstrate a CSS Grid page shell using explicit grid-template-areas: head, side, main, and foot. Desktop gives the sidebar a dedicated column; responsive CSS collapses the areas into a linear flow.

Evidence pages

- ? **inventory.html:** shell header, inventory sidebar, vehicle-card main, global footer.
- ? **services.html:** service shell header, service sidebar, service-card main, global footer.
- ? **inventory-grid** uses three equal columns, then two and one at smaller widths.

Task 4 - 9-image gallery

GRID RHYTHM, CAPTIONS, AND HOVER

showroom.html contains nine gallery figures arranged with `repeat(3, 1fr)`, equal auto rows, consistent gaps, and overlay captions. Hover scales the image and lowers opacity so captions remain readable.

Responsive final result

- ? Desktop: three equal gallery columns with deliberate feature spans.
- ? Tablet: reduced column count and preserved gaps.
- ? Mobile: one column and no horizontal scrolling.

Implementation steps

- ? 1. Define shared semantic layout primitives.
- ? 2. Place supplied logo asset in the shared Flexbox header.
- ? 3. Create equal-height Flexbox card rows.
- ? 4. Add named Grid areas and gallery Grid.
- ? 5. Add responsive media queries and hover/focus states.
- ? 6. Validate local paths, HTTP pages, and GitHub Pages.

Evidence, reflection, and links

FINAL SUBMISSION

Evidence references: index.html demonstrates the supplied logo/header and Flexbox cards; inventory.html demonstrates the Grid page shell; services.html demonstrates Grid plus cards; showroom.html demonstrates the nine-image gallery; all nine pages demonstrate the local logo path.

Reflection

Flexbox is strongest for one-dimensional alignment, navigation, and equal card rows. Grid gives direct control over page regions and gallery composition. The supplied local PNG keeps the brand consistent, accessible, and independent of external UI assets.
